ABI4 is involved in regulating seed development, production of seed nutrient reserves and desiccation protectarts. The nucleic acid an be used to create transgenic plants with modified regulation of seed viability, production of nutrient reserves and desiccation protectants in seeds and vegetative stress tolerance, e.g. to drought or salinity, and
Arabidopsis thaliana homozygous for the abi4-2 (san5) allele are tolerant of high concentrations of sodium chloride (150 mM), mannitol (400 mM), potassium chloride (150 mM), mannitol (400 mM), potassium chloride (150 mM) and sodium sulphate (75 mM). The abi4-2 san5) allele is used to produce Arabidopsis plants that are able to germinate and grow in highly saline soils in which wild-type plants cannot survive. Orthologous alleles from other crop plants can be used to impart similar properties. The present sequence represents the abi4 protein encoded by the mutant allele abi4. This protein contains the APETALA2 domain, but is C-terminally truncated with respect to the wild-type ABI4 protein.

The invention relates to a null, or extremely hypomorphic, allele of the ABI4 gene of Arabidopsis thaliana that confers insensitivity to abscisic acid and tolerance to salinity during germination. The allele, abscisic acid and tolerance to salinity during germination. The allele, designated sans or abi4.2, has a deletion of one of the three adenines at comparines 277-279 relative to the wild-type allele (designated ABI4).

CC ferminus from amino acid residue 44 onwards. The abi4-2 protein contain the APETALA2 (AP2) domain located between cc fransactivational activity at C-repeat/DRE regulatory elements. Seeds of transactivational activity at C-repeat/DRE regulatory elements. Seeds of transactivations of sodium chloride (150 mM), mannitol (400 mM), cf high concentrations of sodium chloride (150 mM), mannitol (400 mM), cc fligh concentrations of sodium sulphate (75 mM). The abi4-2 cannot survive. Orthologous alleles from other crop plants can be used cannot survive. Orthologous alleles from other crop plants can be used contain and grow in highly saline soils in which wild-type plants contains and grow in highly saline soils in which wild-type plants the contains and grow in highly saline soils in which wild-type plants cannot survive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for modulating a response in a target plant to abscisic acid (ABA) by introducing a DNA construct comprising an ABA-associated sequence operably linked to an early kernel/embryo promoter into the plant. The method also involves modulating ABA perception and signal transduction in developing seeds. The method is used to produce plants, particularly cereal plants such as maize, which have a modified response to ABA so that an increase in yield can be produced. The plants are protected against any harmful/detrimental preferts of stress and adverse environmental conditions. The ABA function is disrupted in a tissue and developmental preferred manner so that female reproductive tissue is insulated from the stress or adverse femiliem, conditions. Other plants which can be transformed include rice, cotton, citrus trees, tomatoes, pines, soybean, peanut and olive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA constructs containing an abscisic acid-associated sequence are used to modulate a response in a plant to abscisic acid so that the plants are protected against any harmful or detrimental effects of stress and environmental conditions -

The sequence represents a human secreted protein encoded by a nucleic acid of the invention. Secreted proteins and their related nucleic acids can be used in the diagnosis of or susceptibility to a pathological condition by determining the presence or absence of a mutation in a nucleic acid or the presence or amount of expression of a secreted nucleic acid or the presence or amount of expression of a secreted condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. The antibodies to the polypeptides can also be used in alleviating symptoms associated with disorders and in diagnostic alleviating symptoms associated with disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linkedoc immunosorbent assays (ELISA). The disorders include autoimmune diseases e.g. rheumatoid arthitis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The peptides can also be used to aid wound healing and epithelial cell proliferation, to help prevent skin ageing due to sumburn, to maintain organs before transplantation, to regenerate tissues, in chemotaxis and as a food cransplantation, to regenerate tissues, in chemotaxis and as a food candiditive or preservative to alter storage capabilities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

New maize replication protein A useful for genetic transformation, gene targeting in plants and modulating DNA metabolism -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Maize: Replication protein A: RAA: middle subunit; ZmRPAMSH: virucide; fungicide; insecticide; chromosome 5; DNA-binding protein; DNA repair; DNA metabolism; DNA replication; cell cycle; homologous recombination; pathogen resistance; fungi; virus; nematode; insect; gene therapy; genetic manipulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the maize replication protein A (RPA) middle subunit homologue-1 (ZmRPAMSH1). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the ZmRPAMS homologue is mapped to chromosome 5. This sequence has fungicale, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therappy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Maize replication protein A middle subunit homologue-2 and 3.

The present sequence is the maize replication protein A middle subunit homologue-2 and 3 (ZmRPAMSH2 and ZmRPAMSH3). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the ZmRPAMS homologue is mapped to chromosome 5. This sequence has fungicide, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New maize replication protein A useful for genetic transformation, gene targeting in plants and modulating DNA metabolism -

            The present sequence is the maize replication protein A (RPA) middle subunit homologue-4 (ZmRPAMSH4). RPA is a single-stranded DNA-binding protein required for multiple processes in DNA metabolism, like DNA replication, repair mechanism (e.g. nucleotide excision and double stranded (ds) DNA break repair) and recombination. The gene for the ZmRPAMS homologue is mapped to chromosome 5. This sequence has fungicide, virucide and insecticidal activity. DNA encoding RPA is used for modulating DNA metabolism, influencing cell cycle, enhancing homologous recombination and increasing pathogen resistance in plants. Pests that can be controlled include fungal pathogens, viruses, nematodes and insects. Antisense sequences can be used to block RPA expression and promote non-specific recombination events. RPA protein can be used to improve genetic manipulation and also in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1,

                                                                                                        DIOCEIN TAIGNSC. 271:17609-17612(1996).

-1- FUNCTION: INVOLVED IN IL-1 PATHWAY. THIS KINASE ASSOCIATES WITH THE IL-1 RECEPTOR ILIVOLVED IN IL-1. THIS ASSOCIATION IS RAPID AND IL-1. DEPENDENT (BY SIMILARITY).

-1- TISSUE SPECIFICITY: HIGHLY EXPRESSED IN LIVER, FOLLOWED BY KIDNEY AND SKELETAL MUSCLE.

-1- DEVELOPMENTAL STAGE: EXPRESSED FROM ELD DAY TO BIB DAY.

-1- PRIM. ANTOPHOSPHORYLATED: AN EXTENSIVE PHOSPHORYLATION OF IRAK OCCURS APPER ITS ASSOCIATION WITH ILI-R-1. THIS STEP COULD BE LINKED TO THE ACTIVATION OF THE KINASE (BY SIMILARITY).

-1- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A., AND ALTERNATIVE SPLICING (ISOFORMS BMALL A-F).

XTOLOCK PROCEED IN the mammalian circadian mechanism.";
XTOLOCK PROCEED IN THE MEDILINE SIND TO AN B-BOX ELEMENT (3'-CACGYG-5'), THEREBY ACTIVATING THE SIND TO AN B-BOX ELEMENT (3'-CACGYG-5'), THEREBY ACTIVATING THE RANGERIPTION OF PERI, AND POSSIBLY OF OTHER CIRCADIAN CLOCK PROTEINS.

-1-FUNCTION: CLOCK PROTEINS.
-1-GAGGG-5'), THEREBY ACTIVATING THE RANGERIPTION WITH ANOTHER BHIJH PROTEIN. FORMS AN HETERODIMER WITH CLOCK. INTERACTS WITH HERO, BUT NOT IN VIVO.

-1-GIBCELLULAR LOCATION: NUCLEAR (POTENTIAL).
-1-ALTERNATIVE PRODUCTS: AT LEAST TISSOPRAS; BMALIA (SHOWN HERE), BMALIAJATAY PRODUCTS: AT LEAST TISSOPRAS; BMALIA (SHOWN HERE), BMALIAJATAY. BRECHETION.

-1-TISSUE SPECIFICITY: HIGHLY EXPRESSED IN THE ADULT BRAIN, SKELETAL MUSCLE AND HEART.

-1-SIMILARITY: BELONGS TO THE BASIC HELIX-LOOP-HELIX (BHLH) FAMILY OF TRANSCRIPTION PACTORS. HOMOLOG OF DROSOPHILA CYCLE PROTEIN.

-1-SIMILARITY: CONTAINS! 1 PAS (PER-ARNT-SIM) DIMERIZATION DOMAIN.

"Nucleotide sequence of a cDNA coding for the NADPH-
protochlorophyllide oxidoreductase (PCR) of barley (Hordeum vulgare
L.) and its expression in Escherichia coli.";

Mol. Gen. Genet. 217:555-361(1989).

-! FUNCTION: PHOTOTRANSPORMATION OF PROTOCHLOROPHYLLIDE (PCHLIDE) TO
CHLOROPHYLLIDE (CHLIDE).

-! CATALYTIC ACTIVITY: CHLOROPHYLLIDE A + NADP(+) =
PROTOCHLOROPHYLLIDE + NADPH.

-! PATHWAY: CHLOROPHYLL BIOSYNTHESIS.
-! BUBGELLUIAR LOCATION: CHLOROPLAST.
-! DEVELLOMBYMAT STAGE: ACTIVE ONLY TRANSIENTLY IN ETIOLATED
SEEDLINGS AT THE BEGINNING OF ILLUMINATION.
-! SIMILARITY: BELONGS TO THE SHORT-CHAIN DEHYDROGENASES/REDUCTASES
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hordeum vulgare (Barley).

Natl. Acad. Sci. U.S.A. 89:2321-2325(1992).

-!- FUNCTION: THIS IS A RECEPTOR FOR RETINOIC ACID. THIS METABOLITE
HAS PROFOUND EFFECTS ON VERTEBRAIE DEVELOPMENT. RETINOIC ACID IS
A MORPHOGEN AND IS A POWERFUL TERATOGEN. THIS RECEPTOR CONTROLS
CELLS FUNCTIONS BY DIRECTLY REGULATING GENE EXPRESSION.
-!- SUBCELLULAR LOCATION: NUCLEAR.
-!- DEVELOPMENTAL STAGE: IT IS SYNTHESIZED DURING OOGENESIS AND
PERSISSI IN THE CLEAVING EMBRYO AT APPROXIMATELY CONSTANT LEVELS
UNTIL IT IS DEGRADED JUST BEFORE GASTRULATION N-TERMINAL DOMAIN,
-!- DOMAIN: COMPOSED OF THREE DOMAINS: A MODULATING N-TERMINAL DOMAIN,
-!- SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.
-!- SIMILARITY: BELONGS TO THE NUCLEAR HORMONE RECEPTORS FAMILY.
NR1 SUBFAMILY:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEGUENCE FROM N.A.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description

                                                                                                                                                                                                                                                                                                                   Scoring table:
                                                                                                     OM protein
```

```
The present sequence is the antigenic epitope P605, derived from concluded protein-1 (RAP-1) of the asexual blood stage of computer associated protein-1 (RAP-1) of the asexual blood stage of the protein Capturotion of recombinant present occytainAntwal-1, which is a multivalent, multistage malarial comprises, melittin signal peptide, vaccine. The recombinant protein comprises, melittin signal peptide, vaccine are recombinant protein comprises, melittin signal peptide, cancine are recombinant protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-2 antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg22. These epitopes were obtained at different stages specific antigen, protein-1 (RAP-1) and gamete specific antigen, and can used for treatment and prevention of antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; r-cell epitope; tetanus toxoid; antigenic epitope; treatment; circumsporozoite protein; CSP; sporozoite surface protein-1; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; MSP-2; apical membrane antigen-1; ANA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; Pf927; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;
Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23...30

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant of protein comprises, melitin signal peptide, (His)6 tag, T-cell epitope protein comprises, melitin signal peptide, (His)6 tag, T-cell epitope contects towards to arrive protein-2 (SSP-2), liver stage protein (CSP), sporozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical comparance antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. Chasmodium falciparum. CDC/NIIMALNAC-1 waccine has antiparasitic plasmodium falciparum for treatment and prevention of malarial activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting the content of the protein in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                               Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antigenic polypeptide and DNA encoding it - having a determinant cross reactive with those on the rhostry organelles of the

                                                                                                                                                                                                                    δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their creatment of S. epidermidis infections, e.g. endocarditis. AAH53071 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 to the programming the present invention. AAH55091 to the programming the present invention and primers which are used the present invention of primers which are used to the programming the present of the programming the programming the present invention the present invention.
                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification,
                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S. epidermidis open reading frame protein sequence SEQ ID NO:2230.
                                                                                                                                                                                                                                                                           ö
                                                                                             expression system using plasmid pMC9, and may then be used for immunisation against malaria. The product may also be used diagnostically to detect Abs directed against the parasite.
                                                                          Gene product may be isolated from a transformed E.coli (Y1088)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           epidermidis SR1 strain; infection; diagnosis;

AAH55304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used to a nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the pelypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their creatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 represent oligonucleotide sequences and primers which are used
                                                                                                                                                                                                                                                                                                                                                                                                   ö
however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S. epidermidis open reading frame protein sequence SEQ ID NO:2906.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The polynucleotide sequences given in AAG79799 to AAC79848 encode the human secreted proteins given in AAB4762 to AAB44811. AAB44812 to human secreted proteins sequences and proteins. AAB44829 represent human secreted polypeptide sequences and proteins. CC AAB44829 represent human secreted proteins have activities based on the tissues invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Examples of activities are: corresponding to antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; varorphic; cerebroprotective; antiarthritic; antirheumatic; and neuroprotective; antiarthritic; antirheumatic; and cophthalmological. The polynucleotides and polypeptides can be used to ophthalmological. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, norse, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a copathological condition. Disorders which are diagnosed or treated include disorders, infections caused by bacteria, viruses and fungi and ocular disorders, infections caused by bacteria, viruses and fungi and ocular clasorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sububur, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The

The polynucleotide sequences given in AAC79799 to AAC79848 encode the human secreted proteins given in AAB44762 to AAB44811. AAB44812 to human secreted proteins desequences and proteins forman secreted polypeptide sequences and proteins homen decodes to them, which are used in the exemplification of the present invention. Human secreted proteins have activities based on the tissues invention. Human secreted proteins have activities are:

and cells the genes are expressed in Examples of activities are:

immunosuppressive; antiarthritic; antirheumatic; antiproliferative;

cytostatic; cardiant; vasciropic; cerebroprotective; nootropic;

cytostatic; cardiant; vasciropic; cerebroprotective; and be used to neuroprotective; antibacterial; virucide; fundationed; and copilition in e.g. humans, mice, prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition are diagnosed or treated include pathological condition diseases, hyperproliferative disorders, cardiovascular

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat
          disorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC79790 to AAC79799 and AAB44761 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of
disorders, cerebrovascular disorders, angiogenesis, nervous system
